

the clicks (the Outside): detectors and their clicks only

the GameBoard (the Inside): where no one measures

the symmetry group of the cube: $48 = 24$ rotations + reflections

the phase circle $\mathbb{Z}_N$: the record's clock, a second group

a record at a Node: two integer levels and a remainder

one pair per kind: light [1, 1], matter [800, 809]; the mass

the block: cells of the 48's shape with a lower pair;

its clock the bound mode of its record

a foreign object's table: a shift t of the phase on $\mathbb{Z}_N$, line

one rule of six operations at every Node and interval

a detector: a set of Nodes with a rung W ; it counts when the quadratic form of the record's values in its cells crosses W ; a body is a detector of itself; one click per record, its completion one gather over its detectors, the one non-local step

the click list: (the Node, the detector's own count, the record's birth stamp); nothing else leaves the Inside

ratios

nature

counts per Node:
the fringes, Malus, Bell

counts between clicks on
a body's record: the clock,
the muon, the redshift

from the birth to the click:
Sagnac, the light clock

*every row a ratio, so no
units enter; "matches",
never "is"*

the 48 seen in c 's isotropy
and the cubic dispersion;
 $\mathbb{Z}_N$ in $2\sqrt{2}$ and $\cos^2$;
the pair in the clocks

the passage: the algebra $\rightarrow$ the pin, computed before the run $\rightarrow$ the run Inside $\rightarrow$ the clicks Outside $\rightarrow$ a ratio $\rightarrow$ nature's number
